

VIETNAM CARBON TAX IMPACT SIMULATION

Decision question	Does a USD15/tCO ₂ e price plausibly deliver ~3% emissions reduction, and which policy package best limits the macro and equity trade-offs?
Model type	CGE-anchor replication + transparent policy lever simulation; not a forecast
Reference periods	2030 BAU emissions; 2024 GDP scale proxy; policy calibration published 13 Jul 2026
Version / status	v1.0 / Directional decision model
Prepared	14 Jul 2026
How to use	Start with Executive Summary. Change blue cells in Scenario Comparison and Assumptions Log. All outputs recalculate through named ranges.
Confidence	Directional — core article anchors are medium confidence; behavioural and recycling offsets are explicit low-confidence model assumptions.
